1 Todo List

Member _csv< _T >::set_separator (const std::string &sSep)

Member main (int argc, char **argv)

Parsing command line to get folder name and csv separator, for example.

2 Class Documentation

2.1 _csv< _T > Class Template Reference

This is the templated _csv class, initialized with double by default. STL parallel execution policy does not provide enhancements for simple operations.

```
#include <csv.h>
```

Public Types

• enum eVerbose { QUIET, DEBUG }

Define verbosity values.

Public Member Functions

• _csv ()

This is the default constructor without parameters. These parameters must be set after by methods. It will rise lot of errors if something is missing.

• _csv (const std::string &sFilename, const char &cSep)

This is the constructor with two parameters such as the name of the working file and the separator character as usual with csv.

- _csv (const std::string &sFilename, const std::string &sSep)
- csv (const std::vector< std::vector< T >> &vvData)

This is the constructor fed with external data.

csv (const std::vector< std::string > &vsHeader, const std::vector< std::vector< T > > &vvData)

This is the constructor fed with external header and data.

_csv (const std::vector< std::string > &vsHeader, const std::vector< std::vector< _T > > &vvData, const char &cSep)

This is the constructor fed with external header and data.

bool read ()

Read the content of the file given to the constructor using boost. It detects the header and data consistency with digit sequence: {0123456789eE+-. tab std::endl} and basic regex and dimension matching between header and data line. It is able to recover basic errors such as 'tab'==''. The method put NaN in the grid if an unrecoverable error appends. Data will be store in private variables.

· bool show () const

Show whole data, i.e. the header and data with no restriction on length or terminal size. It uses boost::format in order to correct spacing of number and strings.

· bool show (int iLine_stop) const

Show the header and data until "line_stop" line. Print all columns with terminal end-of-line. It uses boost::format in order to correct spacing of number and strings.

• bool write ()

Write on disk what data are store.

const std::vector< _T > select_line (int line) const

Select the line "line" in data.

const std::vector< _T > select_column (int iCol) const

Select the column "col" in data.

 $\bullet \ \ const \ std::vector < std::vector < _T >> \underline{select} \ (int \ iLine_min, \ int \ iLine_max, \ int \ iCol_min, \ int \ iCol_max) \ const$

Select a sub grid in data, i.e. trim data to the rectangular $[i_{min}, i_{max}] \times [j_{min}, j_{max}]$.

bool set_data (const std::vector< std::vector< _T >> &vvData)

Set data with a vector of a vector.

bool set_column (const std::vector< _T > &vCol, int iCol)

Set a column with a vector.

- bool set_row (const std::vector< _T > &vRow, int iRow)
- bool set_header (const std::vector< std::string > &vsHeader)

Set the header: the first line containing column name.

bool set_filename (const std::string &sFilename)

Set the filename for output or input. The fstream do not care about extension...

bool set_filename_out (const std::string &sFilename)

Set the filename for output. The fstream do not care about extension...

bool set separator (const char &cSep)

Set the csv separator. Usually: '\t', ' ', ',' ::...

bool set_separator (const std::string &sSep)

Set the csv separator. Usually: '\t', '', '.' ::' ...

void set_verbose (eVerbose evV)

Set the verbose mode for debug. It does not deactivate error raising.

• const std::string get_filename () const

Get the filename.

const std::string get_filename_out () const

Get the output filename.

const char get_separator () const

Get the separator.

const size_t get_header_size () const

Get size of the header.

const size_t get_data_size_i () const

Get data line size.

const size_t get_data_size_j () const

Get data column size.

const std::vector< std::vector< _T >> & get_data () const

Get data and return it as a vector of vector.

const std::vector< std::string > & get header () const

Get column names and return it in a vector.

bool empty () const

Check if data are empty, and the emptiness of the first line, i.e. this->data[0].

• bool check_dim ()

Check data dimension consistency, i.e. if all line dimensions are all equal.

• bool genrandspec (_T TMin, _T TMax, _T TStep)

Generate a normalized random spectrum with random gaussian absoption profiles. For TStep < 0.05, you may want to initialize with double.

bool transform lin (T TA, T TB, int iCol)

Do Y=aX+b to the iCol-column.

- bool shift (T TVal)
- bool **shift** (_T TVal, int iCol)
- bool apply_max_threshold (_T TVal)

Delete i line from the grid where data[i][j] > val.

• bool apply_min_threshold (_T TVal)

Delete i line from the grid where $\mathbf{data}[i][j] < val$.

bool apply_max_threshold (_T TVal, int iCol)

Delete i line from the grid where $\mathbf{data}[i][j \neq list] > val$.

• bool apply min threshold (T TVal, int iCol)

Delete i line from the grid where $\mathbf{data}[i][j \neq list] < val$.

· void zeroize ()

Set to zero data. One should find this useful...

void clear ()

Delete data and header.

- csv & operator= (const csv &other) const
- bool operator== (const _csv &other) const
- bool operator!= (const _csv &other) const
- _csv & operator+ (const _csv &other) const

Sum with the 2nd column.

_csv & operator+ (const _T &other) const

Add a constant to the 2nd column.

_csv & operator- (const _csv &other) const

Sum with the 2nd column.

• csv & operator- (const T &other) const

Substract a constant to the 2nd column.

_csv & operator* (const _csv &other) const

Inner product with the 2nd column.

_csv & operator* (const _T &other) const

Multiply by a constant the 2nd column.

_csv & operator/ (const _csv &other) const

Divide element by element the two columns.

_csv & operator/ (const _T &other) const

Divide by a non zero constant the 2nd column.

2.1.1 Detailed Description

```
template<typename _T = double> class _csv< _T >
```

This is the templated _csv class, initialized with double by default. STL parallel execution policy does not provide enhancements for simple operations.

2.1.2 Constructor & Destructor Documentation

```
2.1.2.1 _csv() [1/5] template<typename _T = double>
_csv< _T >::_csv ( )
```

This is the default constructor without parameters. These parameters must be set after by methods. It will rise lot of errors if something is missing.

Default constructor

This is the constructor with two parameters such as the name of the working file and the separator character as usual with csv.

Constructor

Parameters

sFilename	string Name of the input or output file with extension
cSep	char Separator char between column

This is the constructor fed with external data.

Parameters

```
vvData The data
```

This is the constructor fed with external header and data.

Parameters

vsHeader	The vector of column name
vvData	The data

This is the constructor fed with external header and data.

Parameters

vsHeader	The vector of column name
vvData	The data
cSep	char Separator char between column

2.1.3 Member Function Documentation

Delete i line from the grid where $\mathbf{data}[i][j] > val$.

Parameters

TVal	The max threshold

Returns

true if all seems OK

```
2.1.3.2 apply_max_threshold() [2/2] template<typename _T = double> bool _csv< _T >::apply_max_threshold (
```

Delete i line from the grid where $\mathbf{data}[i][j \neq list] > val$.

Parameters

TVal	The max threshold
iCol	Select a column

Returns

true if all seems OK

Delete i line from the grid where $\mathbf{data}[i][j] < val$.

Parameters

Returns

true if all seems OK

Delete i line from the grid where $\mathbf{data}[i][j \neq list] < val$.

Parameters

TVal	The min threshold
iCol	Select a column

Returns

true if all seems OK

```
2.1.3.5 check_dim() template<typename _T = double>
bool _csv< _T >::check_dim ( )
```

Check data dimension consistency, i.e. if all line dimensions are all equal.

Returns

true if dimensions seem OK

```
2.1.3.6 empty() template<typename _T = double>
bool _csv< _T >::empty ( ) const
```

Check if data are empty, and the emptiness of the first line, i.e. this->data[0].

Returns

true if data are empty

```
2.1.3.7 get_data() template<typename _T = double> const std::vector< std::vector< _T >> & _csv< _T >::get_data ( ) const
```

Get data and return it as a vector of vector.

Returns

```
std::vector{<}std::vector{<\_T>>}
```

```
2.1.3.8 get_data_size_i() template<typename _T = double> const size_t _csv< _T >::get_data_size_i ( ) const
```

Get data line size.

Returns

size t

```
2.1.3.9 get_data_size_j() template<typename _T = double>
const size_t _csv< _T >::get_data_size_j ( ) const
Get data column size.
Returns
     size_t
2.1.3.10 get_filename() template<typename _T = double>
const std::string _csv< _T >::get_filename ( ) const
Get the filename.
Returns
     std::string
2.1.3.11 get filename out() template<typename _T = double>
const std::string _csv< _T >::get_filename_out ( ) const
Get the output filename.
Returns
     std::string
2.1.3.12 get_header() template<typename _T = double>
const std::vector< _{\rm T} > & _{\rm csv}< _{\rm T} >::get_header ( ) const
Get column names and return it in a vector.
Returns
```

std::vector<_T>

```
2.1.3.13 get_header_size() template<typename _T = double> const size_t _csv< _T >::get_header_size ( ) const
```

Get size of the header.

Returns

size t

```
2.1.3.14 get_separator() template<typename _T = double> const char _csv< _T>::get_separator ( ) const
```

Get the separator.

Returns

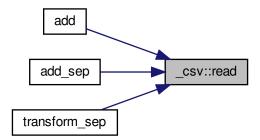

char

```
2.1.3.15 read() template<typename _T = double>
bool _csv< _T >::read ( )
```

Read the content of the file given to the constructor using boost. It detects the header and data consistency with digit sequence: {0123456789eE+-. tab std::endl} and basic regex and dimension matching between header and data line. It is able to recover basic errors such as 'tab'==' '. The method put NaN in the grid if an unrecoverable error appends. Data will be store in private variables.

Returns

true if all seems OK

Select a sub grid in data, i.e. trim data to the rectangular $[i_{min}, i_{max}] \times [j_{min}, j_{max}]$.

Parameters

iLine_min	upper line i_{min}
iLine_max	lower line i_{max}
iCol_min	left column j_{min}
iCol_max	right column j_{max}

Returns

 ${\sf std::vector}{<} {\sf std::vector}{<}_{\sf T}{>} >$

Select the column "col" in data.

Parameters

```
iCol The column to select
```

Returns

std::vector<_T>

Select the line "line" in data.

Parameters

iLine The line to select

Returns

std::vector<_T>

Set a column with a vector.

Set a row with a vector.

Parameters

vCol	std::vector<_T> vCol
iCol	Select a column

Returns

true if all seems OK

Parameters

vRow	std::vector<_T> vRow
iRow	Select a row

Returns

true if all seems OK

Set data with a vector of a vector.

Parameters

vvData std::vector<std::vector<_T> > grid

Returns

true if all seems OK

Set the filename for output or input. The fstream do not care about extension...

Parameters

sFilename	The filename with extension or not.
-----------	-------------------------------------

Returns

true if all seems OK

Set the filename for output. The fstream do not care about extension...

Parameters

sFilename	The filename with extension or not.
-----------	-------------------------------------

Returns

true if all seems OK

Set the header: the first line containing column name.

Parameters

```
vsHeader string vector
```

Returns

true if all seems OK

Set the csv separator. Usually: '\t', ' ', ',', ';' ...

Parameters

ĺ	cSep	The sep character: '\t' for tabulation
ı	000	ino cop characters a for tabaration

Returns

true if all seems OK

```
2.1.3.25 set_separator() [2/2] template<typename _T = double> bool _csv< _T >::set_separator (
```

const std::string & sSep)

Set the csv separator. Usually: '\t', ' ', ',', ';' ...

Todo

Parameters

sSep The sep character: '\t' for tabulation

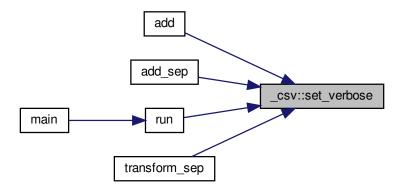

Returns

true if all seems OK

Set the verbose mode for debug. It does not deactivate error raising.

Parameters

evV eVerbose::DEBUG for verbose mode and eVerbose::QUIET to keep quiet

```
2.1.3.27 show() [1/2] template<typename _T = double> void _csv<_T>::show ( ) const
```

Show whole data, i.e. the header and data with no restriction on length or terminal size. It uses boost::format in order to correct spacing of number and strings.

Returns

true if all seems OK

Show the header and data until "line_stop" line. Print all columns with terminal end-of-line. It uses boost::format in order to correct spacing of number and strings.

Parameters

iLine_stop	The number of lines where stop the display
------------	--

Returns

true if all seems OK

Do Y=aX+b to the iCol-column.

Returns

true if all seems OK

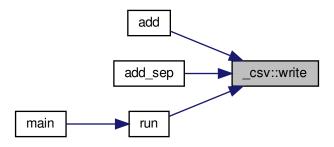

```
2.1.3.30 write() template<typename _T = double>
bool _csv< _T >::write ( )
```

Write on disk what data are store.

Returns

true if all seems OK

Here is the caller graph for this function:

The documentation for this class was generated from the following file:

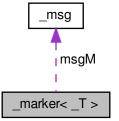

· csv.h

2.2 $_$ marker $< _$ T> Class Template Reference

A class to plot spectra with line markers using py matplotlib.

```
#include <marker.h>
```

Collaboration diagram for $_$ marker< $_$ T >:

Classes

struct Line

Define a line.

Public Types

typedef std::vector< Line > vIList

Public Member Functions

- void set_verbose (const bool bVerbose)
- void set_data (const std::vector< T > &vTX, const std::vector< T > &vTY)
- void set_title (const std::string &sTitle)
- void set_label (const std::string &sLabel)
- void set_xlabel (const std::string &sXlabel)
- void set ylabel (const std::string &sYlabel)
- void set xunit (const std::string &sXunit)
- void set yunit (const std::string &sYunit)
- void set_output (const std::string &sFilename)
- void set_output (const std::string &sFilename, const int iDpi)

Set the picture filename with the extension (png, pdf, jpeg...) and the density (iDpi>50)

void set continuum (const T TContinuum)

Set the continuum position and therefore ymax.

void set_supp (const _T TXmin, const _T TXmax)

Set the support of the first spectrum.

- void set_xmin (const _T TXmin)
- void set xmax (const T TXmax)
- void set_ymin (const _T TYmin)
- void set_ymax (const _T TYmax)
- void set_figsize (int iHeight, int iWidth)
- void set_colorline (const std::string &sColor)

Set the color of the first curve.

- void set_linewidth (float fWidth)
- void set_titlesize (int iSize)
- void set_labelsize (int iSize)
- void set_ticklabelsize (int iSize)
- void set_annotatesize (int iSize)
- void set_legendsize (int iSize)
- void set_continnumsize (float fWidth)
- void set_showgrid (bool bShowgrid)
- void set_scriptname (const std::string &sScriptname)

Set the name of the py script. Default: .plot.py.

void set log (const std::string &sLog)

Enable or disable log file.

void add line (T TWI, const std::string &sName)

Add a marker with a name on the figure.

void add_data (const std::vector< _T > &vTX, const std::vector< _T > &vTY)

Add an additionnal spectrum which has to be plot.

- $\bullet \ \ \ \ \text{void add_data (const std::vector} < _T > \&vTX, \ const \ \ \text{std::vector} < _T > \&vTY, \ const \ \ \text{std::string \&sLabel)}$
 - Add an additionnal spectrum which has to be plot.
- _T get_continuum () const

const std::pair< _T, _T > get_supp ()
 Get the support of the first spectrum.

- const std::string & get_scriptname ()
- const std::string & get_output ()
- const std::string & get_title () const
- const std::string & get_label () const
- · const std::string & get_xlabel () const
- · const std::string & get_xunit () const
- const std::string & get_ylabel () const
- · const std::string & get_yunit () const
- const std::pair< int, int > get_figsize () const

Get the defined figsize, if defined. First: Height and Second: Width.

- int get_dpi () const
- bool make ()

Write spectra, write script with markers.

• int plot ()

Run the py script.

Protected Attributes

• _msg msgM

2.2.1 Detailed Description

```
template<typename _T = float> class _marker< _T >
```

A class to plot spectra with line markers using py matplotlib.

2.2.2 Member Function Documentation

```
2.2.2.1 get_figsize() template<typename _T = float>
const std::pair< int, int > _marker< _T >::get_figsize ( ) const
```

Get the defined figsize, if defined. First: Height and Second: Width.

Returns

std::pair of 2 int

```
2.2.2.2 get_supp() template<typename _T = float>
const std::pair< _T, _T > _marker< _T >::get_supp ( )
```

Get the support of the first spectrum.

Returns

```
std::pair of 2 T: [ x < /em > min x_{max} ]
```

Set the color of the first curve.

Parameters

```
sColor A string like "red", "green", "blue" or and a rgba hex string like "#rrggbbaa"
```

Set the picture filename with the extension (png, pdf, jpeg...) and the density (iDpi>50)

Parameters

sFilename	Picture name
iDpi	Density

Set the support of the first spectrum.

Parameters

TXmin	x_{min}
TXmax	x_{max}

2.2.3 Member Data Documentation

```
2.2.3.1 msgM template<typename _T = float>
    _msg _marker< _T >::msgM [protected]
```

Interface to print message to std output

The documentation for this class was generated from the following file:

· marker.h

2.3 _msg Class Reference

A class that sends string to std output...

```
#include <msg.h>
```

Public Types

enum eMsg { START, MID, END, ERROR, THREADS }

enum for method in order to define whether the message is at the begin, at the end or an error,

Public Member Functions

- _msg (const _msg &other)
- void msg (const std::string &sMsg)

Send a message with eMsg::MID as default.

void msg (eMsg emType, const std::string &sMsg)

Send a message...

· void error (const std::string &sMsg)

Send an error message...

 $\bullet \quad template {<} typename \dots Args {>}$

```
void msg (const Args &...args)
```

A variadic formatter method that indeed sends arbitratry number of variable to the std output... with eMsg::MID as default.

• template<typename ... Args>

```
void msg (eMsg emType, const Args &...args)
```

A variadic formatter method that indeed sends arbitratry number of variable to the std output... The first parameter is always the enum eMsg.

• template<typename ... Args>

```
void error (const Args & ... args)
```

A variable to the std error output... with eMsg::ERROR as default.

• void set name (const std::string sName)

Set the name of the main instance.

void set threadname (const std::string sName)

Set the name of threads.

void set_log (const std::string sLog)

Enable or disable log file.

2.3.1 Detailed Description

A class that sends string to std output...

2.3.2 Member Function Documentation

Send a message...

Parameters

emType	See enum
	eMsg::

The documentation for this class was generated from the following files:

- msg.h
- msg.cpp

2.4 _spectra Class Reference

Public Member Functions

- _spectra (const _spectra &other)
- _spectra & operator= (const _spectra &other)
- bool **operator**== (const _spectra &other) const
- bool operator!= (const _spectra &other) const

The documentation for this class was generated from the following file:

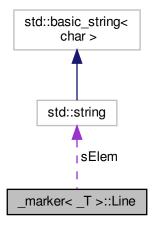

· spectra.h

2.5 _marker< _T >::Line Struct Reference

Define a line.

#include <marker.h>

Collaboration diagram for _marker< _T >::Line:

Public Attributes

- _T **TWI**
- std::string sElem

2.5.1 Detailed Description

template<typename _T = float> struct _marker< _T >::Line

Define a line.

The documentation for this struct was generated from the following file:

· marker.h

3 File Documentation 25

3 File Documentation

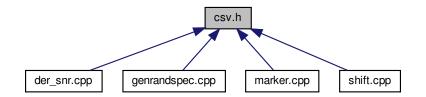

3.1 csv.h File Reference

A basic class for csv manipulation.

```
#include <iostream>
#include <fstream>
#include <chrono>
#include <cmath>
#include <numeric>
#include <random>
#include <cstdarg>
#include <vector>
#include <algorithm>
#include <functional>
#include <iterator>
#include <string>
#include <iomanip>
#include <regex>
#include <boost/spirit/include/qi_parse.hpp>
#include <boost/spirit/include/qi_numeric.hpp>
#include <boost/tokenizer.hpp>
#include "csv.tpp"
Include dependency graph for csv.h:
```

This graph shows which files directly or indirectly include this file:

Classes

class _csv< _T >

This is the templated _csv class, initialized with double by default. STL parallel execution policy does not provide enhancements for simple operations.

3.1.1 Detailed Description

A basic class for csv manipulation.

3.2 der_snr.cpp File Reference

An C++ implementation of the der_snr fortran code from: F. Stoehr et al: DER_SNR: A Simple & General Spectroscopic Signal-to-Noise Measurement Algorithm,

394, Astronomical Data Analysis Software and Systems (ADASS) XVII $\,$

2008ASPC..394..505S This code is multi-threaded or not if not available.

```
#include <iostream>
#include <cstdlib>
#include <cstdio>
#include <fstream>
#include <vector>
#include <algorithm>
#include <string>
#include <cmath>
#include <functional>
#include <fture>
#include <string>
#include <fouctional>
#include <functional>
#include <fouctional>
#include
```

Macros

#define HISTFILE ".history"

Functions

- void compute (const std::vector< std::string > &list, const std::string &sOutput)
- void compute_sep (const std::vector < std::string > &list, const std::string &sOutput, const char &cSep)

Compute S/N for all the string in the vector of strings. Used in the multithreaded mode.

bool merge (const std::string &sPattern)

Merge files from threads following a filename pattern, i.e. the given output name.

- bool write (std::vector< std::string > vsResults, const std::string &sOutput)
- bool write (std::vector< std::string > vsResults, const std::string &sOutput, const char &cSep)

Write on disk results.

float der_snr (const std::vector< float > &vFlux)

Compute the S/N with der_snr method.

- double der_snr (const std::vector< double > &vFlux)
- float median (const std::vector< float > &vFlux)

Simple computation of the median.

- double median (const std::vector< double > &vFlux)
- int main (int argc, char **argv)

This code removes zeros and negative values in csv located in "./data". The maximum of thread has been used to accelerate code.

3.2.1 Detailed Description

An C++ implementation of the der_snr fortran code from: F. Stoehr et al: DER_SNR: A Simple & General Spectroscopic Signal-to-Noise Measurement Algorithm,

394, Astronomical Data Analysis Software and Systems (ADASS) XVII 2008ASPC..394..505S This code is multi-threaded or not if not available.

Remove value under a threshold in a folder or in a file. This code is multi-threaded or not if not available.

3.2.2 Function Documentation

```
3.2.2.1 main() int main ( int argc, char ** argv )
```

This code removes zeros and negative values in csv located in "./data". The maximum of thread has been used to accelerate code.

Todo Parsing command line to get folder name and csv separator, for example.

Here is the call graph for this function:

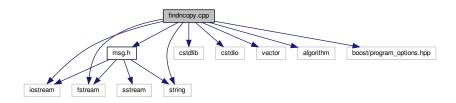

3.3 findncopy.cpp File Reference

Copy files from a list in a new folder.

```
#include <iostream>
#include <cstdlib>
#include <cstdio>
```

```
#include <fstream>
#include <vector>
#include <string>
#include <algorithm>
#include <boost/program_options.hpp>
#include <msg.h>
```

Include dependency graph for findncopy.cpp:

Macros

• #define HISTFILE ".history"

Functions

- std::vector< std::string > parse_filelist (std::fstream &flux)
 - Create a vector of strings from the filelist.
- std::vector< std::string > get_fullrpath (std::vector< std::string > &vsFilelist, const fs::path &fspPidir)
 Get the full relative path of all file.
- std::vector< std::string > get_fullrpath (std::vector< std::string > &vsFilelist, const fs::path &fspPidir, const std ← ::string &sExclude)

Get the full relative path of all file and exclude a string in paths.

- void erase_string (std::vector< std::string > &vsFullrpath, const std::string &sToerase)
 - Erase a string pattern in the path list.
- std::vector< std::string > make_dir_list (const fs::path &fspPath, const std::string &sDirbase)

Make a list of the folder structure.

- void make_dir (const std::vector< std::string > &vsBaserpath, const std::string &sOfolder)
 - Recreate the folder structure.
- void copy_file (std::vector< std::string > &vsFullrpath, const std::string &sOfolder, const std::string &sIfolder)

 Copy the found files.
- int main (int argc, char **argv)

3.3.1 Detailed Description

Copy files from a list in a new folder.

3.4 genrandspec.cpp File Reference

Generate a set of randomized-flux spectra between two wavelengths for test purposes.

```
#include <iostream>
#include <cstdlib>
#include <cstdio>
#include <fstream>
#include <vector>
#include <algorithm>
#include <numeric>
#include <string>
#include <cmath>
#include <random>
#include <thread>
#include <future>
#include <ctime>
#include <boost/program_options.hpp>
#include <csv.h>
#include <msg.h>
Include dependency graph for genrandspec.cpp:
```

Macros

- #define HISTFILE ".history"
- #define MaxFilepDir 10

Set the maximum number of files to create in a folder.

Functions

- void run (const std::string &sOutput, char cSep, float fMinw, float fMaxw, float fStep)
 Write random spectra on disk.
- int main (int argc, char **argv)

3.4.1 Detailed Description

Generate a set of randomized-flux spectra between two wavelengths for test purposes.

Author

Audric Lemonnier

3.4.2 Macro Definition Documentation

3.4.2.1 MaxFilepDir #define MaxFilepDir 10

Set the maximum number of files to create in a folder.

\define MaxFilepDir

3.5 marker.cpp File Reference

Include dependency graph for marker.cpp:

Highlight lines on spectrum.

```
#include <iostream>
#include <cstdlib>
#include <cstdio>
#include <fstream>
#include <vector>
#include <tuple>
#include <string>
#include <algorithm>
#include <iterator>
#include <boost/program_options.hpp>
#include <boost/spirit/include/qi_parse.hpp>
#include <boost/spirit/include/qi_numeric.hpp>
#include <marker.h>
#include <msg.h>
#include <csv.h>
```

Macros

- #define LOGFILE ".marker.log"
- #define **HISTFILE** ".history"

Functions

• int main (int argc, char **argv)

3.5.1 Detailed Description

Highlight lines on spectrum.

3.6 msg.h File Reference

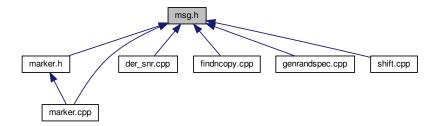

A class to print and write message.

```
#include <iostream>
#include <fstream>
#include <string>
#include <sstream>
```

Include dependency graph for msg.h:

This graph shows which files directly or indirectly include this file:

Classes

class msg

A class that sends string to std output...

3.6.1 Detailed Description

A class to print and write message.

3.7 shift.cpp File Reference

Shift whole spectrum by a given wavelength. This code is multi-threaded or not if not available.

```
#include <iostream>
#include <vector>
#include <algorithm>
#include <thread>
#include <future>
#include <string>
#include <boost/program_options.hpp>
```

```
#include <boost/range/iterator_range.hpp>
#include <csv.h>
#include <msg.h>
```

Include dependency graph for shift.cpp:

Macros

- #define CLIGHT 299792.458
- #define HISTFILE ".history"

Functions

- $\bullet \ \ \mathsf{void} \ \mathsf{add} \ (\mathsf{const} \ \mathsf{std} :: \mathsf{vector} < \mathsf{std} :: \mathsf{string} > \& \mathsf{vsList}, \ \mathsf{float} \ \mathsf{fWavelength}) \\$
 - Add the defined wavelength to the first column of spectra. Default sep is '\t'.
- void add_sep (const std::vector< std::string > &vsList, char cSep, float fWavelength)

Add the defined wavelength to the first column of spectra.

- $\bullet \ \ \text{void transform_sep (const std::vector} < \ \text{std::string} > \& \ \text{vsList, char cSep, float fVr)} \\$
 - Correct the radial velocity effect on spectra. Perform a linear transformation.
- int main (int argc, char **argv)

3.7.1 Detailed Description

Shift whole spectrum by a given wavelength. This code is multi-threaded or not if not available.

Author

Audric Lemonnier

Version

0.3
